

# Collections Data Quality Report

Golden dataset integrity, forensic checks and business impact

## 1. Golden Dataset Integrity

30,000 account records | 30,000 unique account IDs

Duplicate account IDs: 0 | Missing values: 0

Assessment: clean account-level analytical dataset with complete coverage.

## 2. Duplicate Payments

Raw payments: 25,500 rows | Unique payment IDs: 25,000 | Duplicate rows: 500

Duplicate SUCCESS amount: 0, so identified duplicates do not appear to inflate successful recovery.

Business impact: data-quality risk exists, but no material successful-recovery inflation was identified.

## 3. PTP-to-Payment Attribution

Diagnostic account-level matches: 2,741 | Valid timing-qualified matches: 189

Valid attribution rate: 6.90%

Business impact: PTP-linked recovery claims have limited attribution confidence without stricter event-window logic.

## 4. Agent–Vendor Mapping

Unique agents in calls: 1,000 | Agents mapped to multiple vendors: 1,000 (100%)

Calls handled by multi-vendor agents: 88,241 (96.6% of calls)

Business impact: agent/vendor performance comparisons may be unreliable without identity resolution.

## 5. Timezone & Timestamp Handling

Calls with timezone populated: 91,350 / 91,350 (100%)

Timezones observed: Asia/Kolkata, Asia/Dubai and UTC; event\_at is stored as a timezone-naive string.

Treatment: use the row-level local hour with its corresponding timezone; do not apply a single global timezone conversion.

## Overall Data Quality Assessment

|                      |                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------|
| Structural quality   | Strong — Golden dataset has no duplicate IDs or missing values.                                   |
| Attribution quality  | Needs caution — PTP/payment and agent/vendor mappings require controlled attribution.             |
| Business implication | Headline recovery trends are usable, but causal credit to channels, agents or vendors is limited. |
